Persona

Alef is 28 years old. He is a civil engineer, married, with two children. Alef and his wife want to request a loan credit as financing to acquire their dreamed farm house.

Scenario of Use

Alef decides to obtain a loan approval to finance the acquiring of his farm house. It starts when he authenticates into his bank provider's system. Once authenticated the system requires the estimated amount of money, personal information, and details about the project. Then, the system shows a recommendation of a *granted* loan approval 50% higher than Alef requested, a confidence value for this recommendation, and a feature-based graph as explanation for it. Alef tends to believe in the system recommendation and accepted the new loan approved, even considering that the amount acquired is bigger than the estimated budget for the project and it will have a greater cost for his financial planning.
